## INTRODUCTION

- Reading news is a regular hobby for almost all the people in this world. Different people like different categories of news like sports, entertainment, political etc.
- It is recommended to news websites to organize them into categories so that users may quickly get access to the categories of news that they are interested.
- In Natural Language Processing (NLP), text classification is a classical problem which aims assigning labels or tags to vectors has various applications like text summarization, question answering, sentiment analysis, news categorization and so on.

## PROJECT OBJECTIVE

The main objective of the project is to classify a news article into different categories like politics, entertainment etc.

## PROJECT BENEFICIARIES

- It simplifies the task of classifying the news based on different categories.
- It also helps to get access to the specific article quickly rather than searching manually.

## DATASET INSIGHTS

Each record in the dataset consists of the following attributes:

**category:** category in which the article was published.

**headline:** the headline of the news article.

**authors:** list of authors who contributed to the article.

**link:** link to the original news article.

**short\_description:** Abstract of the news article.

**date:** publication date of the article.

## ALGORITHM USED

- ✓ Bi-Directional Encoder Representation From Transformers
- ✓ BERT Large — 24 layers (transformer blocks), 16 attention heads, 340 million parameters, and has an output size of 1024-dimensions.

- Loss : categorical\_crossentropy
- Activation function : softmax
- Optimizer : Adam
- Total params: 335,182,888
- Trainable params: 335,182,888
- Non-trainable params: 0

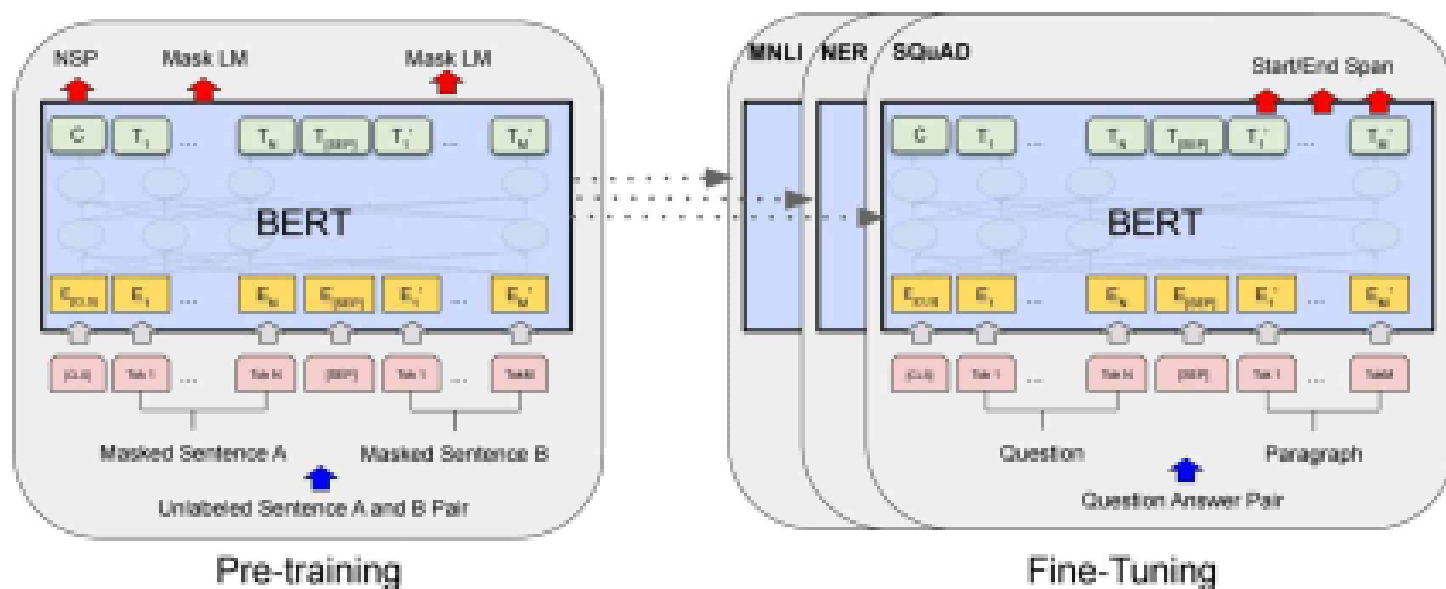

Figure 1: Overall pre-training and fine-tuning procedures for BERT. Apart from output layers, the same architectures are used in both pre-training and fine-tuning. The same pre-trained model parameters are used to initialize models for different down-stream tasks. During fine-tuning, all parameters are fine-tuned. [CLS] is a special symbol added in front of every input example, and [SEP] is a special separator token (e.g. separating questions/answers).

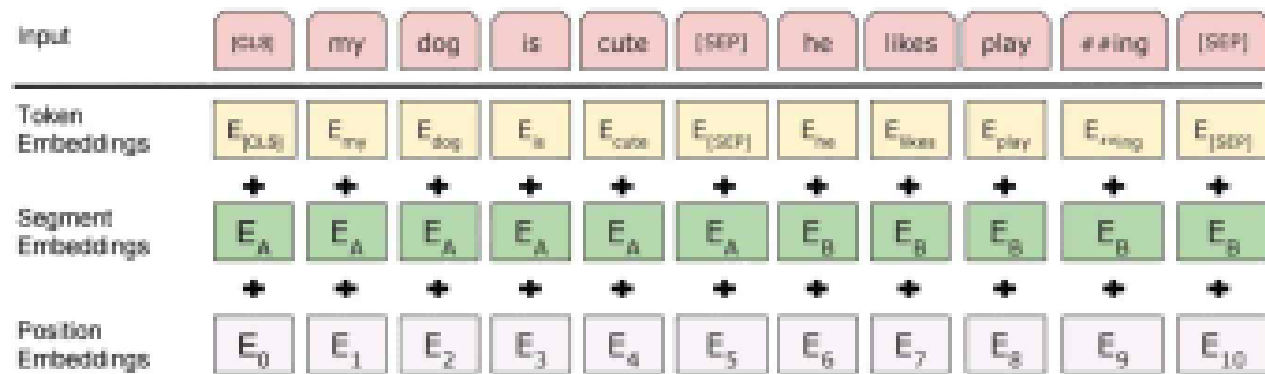

Figure 2: BERT input representation. The input embeddings are the sum of the token embeddings, the segmentation embeddings and the position embeddings.
